

Window Manager in the SURVEY Program

By Lazar Pevac

FIGURE 1. Window Manager

The Window Manager helps you to better organize all SURVEY-related windows. When you open it, you will see a list of all windows controlled by SURVEY on the left. Each title is prepended with a number that indicates the monitor id in which the middle point of the window lies.

Sometimes you will see 0 as monitor id. This happens if the whole window is positioned outside of the monitor. This situation commonly occurs when you remove a monitor from your system or when you copy the project file from a system that has two or more monitors to a system that has one monitor less.

There is a simple remedy for such problem.

1. **Click on the list item indicating 0 monitor id.**
2. **In the monitor list box, select the monitor to which you want to restore the window.**
3. **Click the “Tile” button.** It will bring “lost” window to selected monitor.

Let’s explain the purpose of each button in the Window Manager:

	Minimizes all selected windows. (Their minimized icon is positioned above the status bar)
	Restores all selected windows from the minimized state to the original size and position.
	Hides all selected windows. Their titles remain in the list and there is no minimized icon associated with the window. You can bring the window back by clicking on the “Restore” button.
	Tiles all selected windows on the chosen monitor. The tiling algorithm is content sensitive. It applies a different tiling method according to the nature of selected windows.
	Cascades all selected windows on the chosen monitor.
	Save all windows positions and dimension in .ini file.
	Restore all windows positions and dimension from .ini file.

The Save/Restore combination is very useful if several people are using the SURVEY program in the same project. Then each of them can save his/her favored configuration and open it when the program starts.
