

Shared Memory Output Multi-vessel Option

By Lazar Pevac

The new version of SHARED MEMORY OUTPUT allows you to export multiple vessel information to the output port of your choice. To achieve this goal, we have changed the user interface slightly.

All work is done in the file selection area. Instead of one list of check boxes, we have one list for selected fields (on the right) and multiple lists of possible field candidates (on the left). The multiple lists are separated using tabs. There is one page containing general items, while the remaining pages are reserved for vessel-related items. Each page has a title corresponding to the vessel name.

To move an item from left to right (or right to left), you select it on left (or right) list and you click right (or left) arrow. You can drag items on each list to change item position within the list. Additionally, you can use the up (or down) arrow to move items within right-hand list.

The new version of the program saves settings using a different format, but it can read the old ini files.
