

Tracking Point Slope Windows in Survey

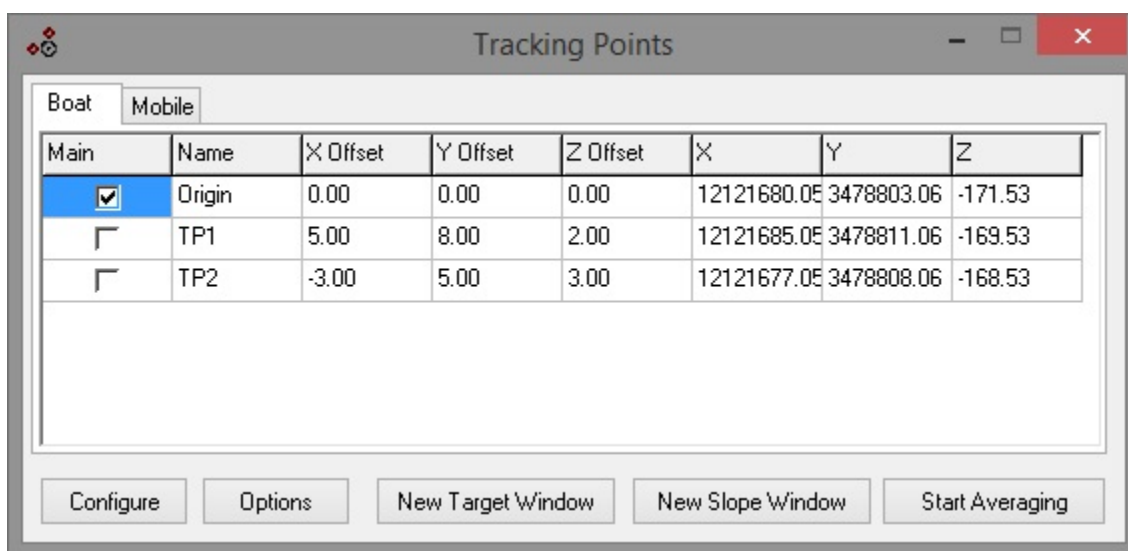

By John Marinuzzi

In the November 2013 of *Sounding Better!*, I wrote about a new [Multiple Offsets option in Survey](#). We have since decided to call these Tracking Points. Over the past few months we have been adding functionality by expanding it to mobiles and creating Tracking Point to Target Windows. The next step is Tracking Point Slope Windows.

Tracking Point Slope Windows enable you to track the slope, angle, and horizontal and vertical distances between two tracking points.

In the Tracking Points window, there is now a “New Slope Window” button.

FIGURE 1. Sample Tracking Points Window

Click [New Slope Window] to display another dialog that looks like this:

FIGURE 2. Designating the Tracking Points to Compare

Here you decide which Tracking Points to track from the pull-down menus. Then a separate window is created to display the data:
