

Kongsberg Network Driver

By Jerry Knisley

The driver for the KONGSBERG NETWORK device was worked on recently to enhance the method used in down sampling. In the past, there were cases when the range calculation would not compute properly.

In Figure 1, the top image is from the HYPACK® SIDE SCAN SURVEY program and the bottom screen is from the EA400 software. The changes were tested with three individual sets of data from the EA400 software, all with varying range settings. The updated driver should be available in the HYPACK® 2015 release as version 15.0.1.13
