

Targets in Grid Conversion

By Joseph Adamski

One of the many programs that utilizes our new target system in 2015 is Grid Conversion. If you are unfamiliar with the program, it allows you to convert from Latitude/Longitude to X/Y and vice versa for specific points. It is found under the UTILITIES-GEODESY item in the HYPACK shell menu.

The point list is stored in the Grid Conversion .ini file so as not to lose your work between sessions, but they are not automatically saved to the target database. Once you have finished your list of points, click [Save List...] to save each point into the GEOCONV target group. The names you gave the points in Grid Conversion will be carried over.

FIGURE 1. Click [Save List...] to Send to The Target Database—GRID CONVERSION (left) and The New Target Listed in the Shell (right).
